

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger**  
on Friday 23 01 2026 →

Persistent  
weak layer

**Weakly bonded old snow represents the main danger.**

Fresh and older wind slabs are prone to triggering. These can be released in the weakly bonded old snow, even by a single winter sport participant. Avalanches can reach medium size. The avalanche prone locations are to be found in particular on west to north to east facing aspects above approximately 2200 m. Individual avalanche prone locations are to be found also on steep south facing slopes above approximately 2400 m. Caution is to be exercised in particular in gullies and bowls, and behind abrupt changes in the terrain, as well as on wind-loaded slopes. The avalanche prone locations are barely recognisable.

Whumping sounds and the formation of shooting cracks when stepping on the snowpack can indicate the danger.

Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

## Snowpack

### Danger patterns

dp.5: snowfall after a long period of cold

dp.6: cold, loose snow and wind

The sometimes strong wind has transported some snow. This applies in particular in the regions of the south that are exposed to the foehn wind. The fresh and older wind slabs are lying on top of a weakly bonded old snowpack. They are bonding only slowly with the old snowpack. Distinct weak layers exist in the old snowpack. The old snowpack consists of faceted crystals.

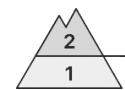

The snowpack will be generally subject to considerable local variations. Steep sunny slopes: As a consequence of solar radiation a crust formed on the surface during the last few days. Only a small amount of snow is lying for the time of year in all altitude zones.

## Tendency

The fresh and older wind slabs can be released by a single winter sport participant.

## Danger Level 2 - Moderate

2400m

**Tendency:** Constant avalanche danger

Wind slab

Wind slabs are to be avoided.

The somewhat older wind slabs remain in some cases prone to triggering. These can be released in the weakly bonded old snow by a single winter sport participant.

The avalanche prone locations are to be found in particular on west to north to east facing aspects above approximately 2400 m and adjacent to ridgelines and in gullies and bowls. Such avalanche prone locations are clearly recognisable to the trained eye. In very isolated cases avalanches are medium-sized.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

## Snowpack

### Danger patterns

(dp.6: cold, loose snow and wind)

The wind slabs are mostly rather small but prone to triggering. They are bonding only slowly with the old snowpack. The old snowpack consists of faceted crystals.

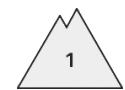

The snowpack will be generally subject to considerable local variations. Steep sunny slopes: As a consequence of solar radiation a crust formed on the surface during the last few days. Only a small amount of snow is lying for the time of year in all altitude zones.

## Tendency

The avalanche prone locations are to be found in particular in steep terrain at elevated altitudes. Wind slabs are to be avoided.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Friday 23 01 2026

### Wind slabs require caution.

Wind slabs can in isolated cases be released. Caution is to be exercised in particular on very steep shady slopes, as well as adjacent to ridgelines and in gullies and bowls above approximately 2200 m. Mostly avalanches are small.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

### Snowpack

The wind slabs are lying on unfavourable layers at elevated altitudes. The old snowpack consists of faceted crystals.

The snowpack will be generally subject to considerable local variations. Only a small amount of snow is lying for the time of year in all altitude zones.

### Tendency

Low avalanche danger will prevail.
