

Danger Level 2 - Moderate

Tendency: Constant avalanche danger
on Friday 12 12 2025 →

Wind slabs and wet snow require caution.

On Sunday the wind was moderate to strong. The sometimes deep wind slabs of the last few days can be released, especially by large additional loads, in particular on east to south to west facing aspects above approximately 2200 m. This applies in particular on wind-loaded slopes, and at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example. As a consequence of warming during the day and solar radiation more small and, in isolated cases, medium-sized moist and wet avalanches are possible, in particular in case of releases originating from steep sunny starting zones that have retained the snow thus far.

Snowpack

Danger patterns

(dp.6: cold, loose snow and wind)

The moderate wind has transported some snow. The fresh and somewhat older wind slabs have bonded quite well with the old snowpack. Sunshine and high temperatures will give rise as the day progresses to increasing moistening of the snowpack in particular on sunny slopes at low and intermediate altitudes.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger
on Friday 12 12 2025 →

Wind slabs and weakly bonded old snow represent the main danger.

On Sunday the wind was moderate to strong. The avalanche prone locations are to be found in particular in steep terrain at high altitudes and in high Alpine regions and adjacent to ridgelines and in gullies and bowls, where the fresh and older wind slabs are lying on weak layers. In isolated cases the avalanches are medium-sized and can mostly be released by large loads. This applies in particular along the border with France.

As a consequence of warming during the day and solar radiation only isolated small and, in isolated cases, medium-sized moist and wet snow slides are possible, in particular in case of releases originating from steep sunny starting zones that have retained the snow thus far.

Below approximately 2200 m from a snow sport perspective, insufficient snow is lying. Watch out for the numerous rocks hidden by the recent snow.

Snowpack

Danger patterns

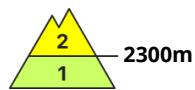

dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

The sometimes moderate wind has transported the fresh and old snow. Towards its base, the snowpack consists of faceted crystals. The fresh and somewhat older wind slabs are poorly bonded with the old snowpack. As a consequence of highly fluctuating temperatures a crust formed on the surface during the last few days. Sunshine and high temperatures will give rise as the day progresses to moistening of the snowpack in particular on sunny slopes at low and intermediate altitudes. At low and intermediate altitudes thus far only a little snow is lying.

Snowpack

Danger patterns

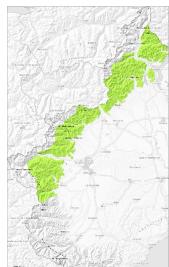

dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

The sometimes moderate wind has transported some snow. Towards its base, the snowpack consists of faceted crystals. The fresh and somewhat older wind slabs are bonding only slowly with the old snowpack, especially on shady slopes. At low and intermediate altitudes thus far only a little snow is lying. As a consequence of highly fluctuating temperatures a crust formed on the surface during the last few days. Sunshine and high temperatures will give rise as the day progresses to moistening of the snowpack in particular on sunny slopes at low and intermediate altitudes.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Friday 12 12 2025

In these regions only a little snow is lying.

In all altitude zones from a snow sport perspective, in most cases insufficient snow is lying.

Watch out for the numerous rocks hidden by the recent snow.

Snowpack

In all aspects thus far only a little snow is lying in all altitude zones. Sunshine and high temperatures will give rise as the day progresses to moistening of the snowpack in particular on sunny slopes at low and intermediate altitudes.

Tendency

The avalanche danger will persist.
