

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger**  
on Sunday 30 11 2025 →

The fresh wind slabs are to be evaluated with care and prudence and generally at high altitudes and in high Alpine regions.

The wind slabs of last week must be evaluated with care and prudence in particular on north to east to southeast facing aspects above approximately 2200 m, in particular at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

## Snowpack

### Danger patterns

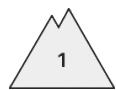

dp.6: cold, loose snow and wind

From a snow sport perspective, in most cases insufficient snow is lying, especially at low and intermediate altitudes.

Snow depths vary greatly at high altitudes and in high Alpine regions, depending on the influence of the wind.

## Danger Level 1 - Low

A mostly favourable avalanche situation will prevail.

The snowpack will be generally stable.

The numerous rocks hidden by the recent snow are the main danger. Dry avalanches can in very isolated cases be released, in particular by large loads, but they will be small in most cases. Very isolated avalanche prone locations are to be found at intermediate and high altitudes.

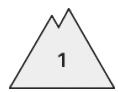

### Snowpack

In all aspects thus far only a little snow is lying in all altitude zones. The snowpack consists of faceted crystals; its surface consists of loosely bonded snow, especially on shady slopes. On sunny slopes the snowpack is frozen but the crust is only thin.

The high humidity gave rise to moistening of the snowpack in some places in particular at low altitude. There is a danger of falling on the icy crust.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Sunday 30 11 2025

The snowpack will be generally stable.

The avalanche prone locations are rather rare. The snowpack will be generally stable.

The numerous rocks hidden by the recent snow are the main danger. Dry avalanches can in isolated cases be released by large loads, but they will be small in most cases. Very isolated avalanche prone locations are to be found on northeast to east to southeast facing aspects at intermediate and high altitudes.

### Snowpack

In all aspects thus far only a little snow is lying in all altitude zones. The snowpack consists of faceted crystals; its surface consists of loosely bonded snow, especially on shady slopes. On sunny slopes the snowpack is frozen but the crust is only thin. The old snowpack is hard.
