

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Saturday 03 01 2026

Persistent  
weak layer

2000m

**Weakly bonded old snow above approximately 2000 m.**

Weak layers in the old snowpack can be released in isolated cases and mostly by large additional loads at high altitude. Individual small avalanches are not entirely ruled out.

## Snowpack

The old snowpack remains generally well bonded. The wind will be strong to storm force over a wide area.
