Danger Level 3 - Considerable

New snow and wind slabs represent the main danger.

Gradual increase in danger of dry and wet avalanches as a consequence of the new snow. The avalanche prone locations are to be found in all aspects above approximately 1800 m and in gullies and bowls, and behind abrupt changes in the terrain. Wind-loaded slopes where surface hoar has been covered with snow are unfavourable. Avalanches can occur easily or triggered naturally.

Snowpack

Danger patterns (dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

The new snow is lying on the unfavourable surface of an old snowpack in particular on steep sunny slopes above approximately 2000 m. In the course of the day sometimes deep wind slabs formed especially adjacent to ridgelines and in gullies and bowls. Also shady slopes where surface hoar has been covered with snow are dangerous.

Danger Level 2 - Moderate

Tendency: Increasing avalanche danger on Thursday 13 03 2025

Snowpack stability: fair Frequency: some Avalanche size: medium

Dry and moist avalanches are possible already during the day.

The new snow and wind slabs can be released naturally in all aspects.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

dp.2: gliding snow

In many cases new snow and wind slabs are lying on a moist old snowpack.

Danger Level 1 - Low

Tendency: Increasing avalanche danger on Thursday 13 03 2025

Snowpack stability: fair Frequency: few Avalanche size: small

Moist and wet avalanches are possible.

As a consequence of the precipitation individual small moist and wet avalanches are possible.

Snowpack

Danger patterns

dp.10: springtime scenario

The snowpack will become in most cases wet all the way through.
