# **Danger Level 2 - Moderate**

#### New snow and wind slabs represent the main danger.

The avalanche prone locations are to be found in particular adjacent to ridgelines above approximately 2000 m and in gullies and bowls, and behind abrupt changes in the terrain. Wind-loaded slopes where weaknesses exist in the old snowpack are unfavourable.

#### Snowpack

**Danger patterns** 

(dp.6: cold, loose snow and wind

(dp.1: deep persistent weak layer )

The snowpack will become in some cases unfavourable. In the course of the day sometimes deep wind slabs will form especially adjacent to ridgelines and in gullies and bowls. Also shady slopes where weaknesses exist in the old snowpack are dangerous.

# **Danger Level 1 - Low**

**Tendency: Increasing avalanche danger** on Tuesday 11 03 2025

Snowpack stability: fair
Frequency: some
Avalanche size: small

### Natural dry avalanches are possible in isolated cases.

The new snow and wind slabs can be released naturally especially on shady slopes.

### Snowpack

**Danger patterns** 

dp.6: cold, loose snow and wind

dp.2: gliding snow

As a consequence of highly fluctuating temperatures and solar radiation the snowpack consolidated. In many cases new snow is lying on a moist old snowpack.
