## Wednesday 23.04.2025

Published 22 04 2025, 17:00

#### **Danger Level 1 - Low**

**Tendency: Constant avalanche danger** on Thursday 24 04 2025

Snowpack stability: very poor

Frequency: few

Avalanche size: small

### Moist and wet avalanches are the main danger.

Above approximately 1900 m small and, in isolated cases, medium-sized natural wet avalanches are possible. The avalanche prone locations are to be found especially at the base of rock walls and on steep sunny slopes.

#### Snowpack

**Danger patterns** 

dp.10: springtime scenario

At low and intermediate altitudes no snow is lying. At elevated altitudes the snowpack is subject to significant local variations. The older wind slabs are to be found especially in gullies and bowls, and behind abrupt changes in the terrain. The old snowpack remains moist in all altitude zones. The weather conditions will give rise to increasing and thorough wetting of the snowpack.
