EUROPEAN AVALANCHE WARNING SERVICES

| | 1 low | 2 moderate | 3 considerable | 4 high | 5 very high |

Danger Level 2 - Moderate

2 / **1** 2200m

Tendency: Constant avalanche danger →
on Friday 23 01 2026

Wind slab — 2200m

Persistent weak layer — 2200m

Persistent weak layer — 2200m
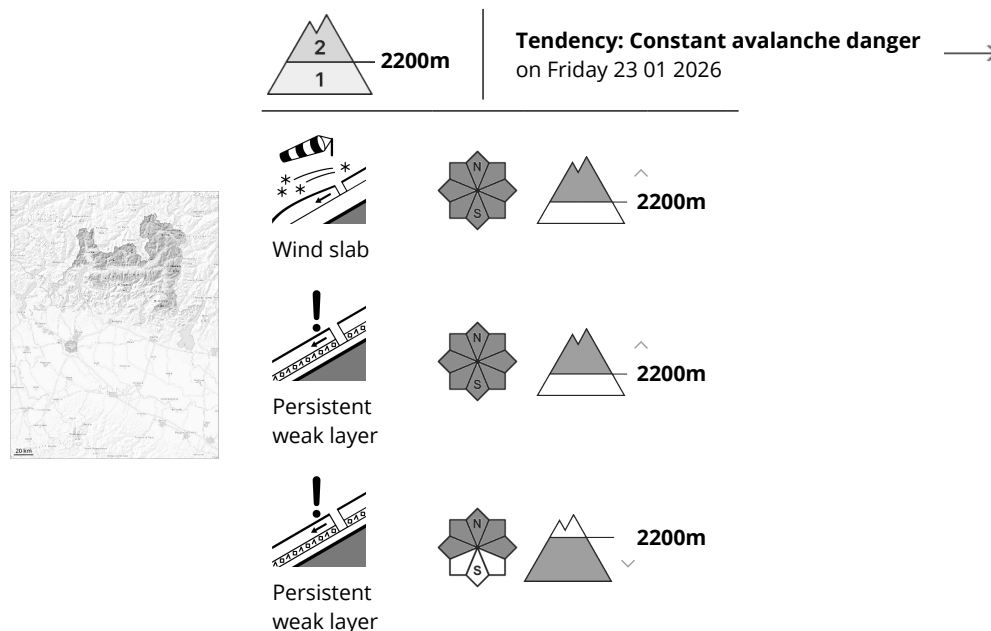

Fresh and somewhat older wind slabs represent the main danger. Dry slab avalanches are possible.

Wind slabs are lying on old snow containing large grains. Caution is to be exercised on wind-loaded slopes adjacent to ridgelines and in gullies and bowls.

In some cases the avalanches are medium-sized and can be released even by a single winter sport participant.

Snowpack

**Danger patterns**   (dp.6: cold, loose snow and wind)   (dp.1: deep persistent weak layer)

The strong wind has transported the new snow. The avalanche-prone wind slabs are lying on weak layers in particular on wind-protected shady slopes above approximately 2200 m. Avalanches can be released by small loads.

The snowpack will be generally subject to considerable local variations. At low and intermediate altitudes from a snow sport perspective, insufficient snow is lying.

Danger Level 1 - Low

Tendency: Constant avalanche danger
on Friday 23 01 2026

Wind slab

1500m

Fresh wind slabs represent the main danger. Faceted weak layers exist in the snowpack especially on shady slopes.

Faceted weak layers exist in the snowpack especially on shady slopes. Mostly the avalanches are small.
Snowpack

Danger patterns   (dp.1: deep persistent weak layer)

Individual avalanche prone locations are to be found in shady places that are protected from the wind. From a snow sport perspective, in most cases insufficient snow is lying.

Danger Level 1 - Low

Tendency: Constant avalanche danger
on Friday 23 01 2026

Wind slab

1500m

Wind slabs represent the main danger.

In shady places that are protected from the wind and on very steep slopes individual slab avalanches are possible, but they will be mostly small.

Snowpack

Danger patterns dp.1: deep persistent weak layer

Isolated avalanche prone weak layers exist in the snowpack especially on shady slopes. The wind slabs are lying on weak layers.
