

Avalanche danger

updated on 8.5.2026, 17:00

Morning

As the day progresses

region A

Considerable (3-) Dry avalanches, whole day

Persistent weak layers

Avalanche prone locations

Danger description

The new snow and wind slabs of the last few days are lying on the unfavourable surface of an old snowpack. Single winter sport participants can release avalanches in some places. Mostly avalanches are medium-sized. Experience in the assessment of avalanche danger is required.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2) Wet-snow avalanches, as the day progresses

Wet snow

As a consequence of warming during the day natural wet avalanches are possible. This applies in particular on steep north facing slopes between approximately 2200 and 2600 m, but in isolated cases also on very steep east and west facing slopes between approximately 2500 and 3000 m. Mostly avalanches are medium-sized.

Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

region B

Moderate (2=) Dry avalanches, whole day

Persistent weak layers

Avalanche prone locations

Danger description

Dry avalanches can in isolated cases be released in near-surface layers and reach medium size. Careful route selection is recommended. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2) Wet-snow avalanches, as the day progresses

Wet snow

As a consequence of warming during the day natural wet avalanches are possible. This applies in particular on steep north facing slopes between approximately 2200 and 2600 m, but in isolated cases also on very steep east and west facing slopes between approximately 2500 and 3000 m. Mostly avalanches are medium-sized. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

region C

Moderate (2-) Dry avalanches, whole day

No distinct avalanche problem

Avalanche prone locations

Danger description

Dry avalanches can in isolated cases be released in near-surface layers. Mostly the avalanches are small. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2) Wet-snow avalanches, as the day progresses

Wet snow

As a consequence of warming during the day natural wet avalanches are possible. This applies in particular on steep north facing slopes between approximately 2200 and 2600 m, but in isolated cases also on very steep east and west facing slopes between approximately 2500 and 3000 m. Mostly avalanches are medium-sized. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

region D

Low (1) Dry avalanches, whole day

No distinct avalanche problem

Avalanche prone locations

Danger description

Dry avalanches can in isolated cases be released in near-surface layers. This applies in particular on extremely steep north facing slopes. Mostly the avalanches are small. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.
The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2) Wet-snow avalanches, as the day progresses

Wet snow

As a consequence of warming during the day natural wet avalanches are possible. This applies in particular on steep north facing slopes between approximately 2200 and 2600 m, but in isolated cases also on very steep east and west facing slopes between approximately 2500 and 3000 m. Mostly avalanches are medium-sized.
Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

region E

Low (1)

Wet snow, Gliding snow

As a consequence of warming during the day and solar radiation individual wet and gliding avalanches are possible, in particular on steep north facing slopes. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

Snowpack and weather

updated on 8.5.2026, 17:00

Snowpack

In high Alpine regions, the last few days' fresh and drifted snow is lying primarily on steep north-facing slopes on faceted weak layers in the top part of the old snowpack. Avalanche reports from recent days confirm that these weak layers are in some cases prone to triggering.

Further saturation of the snowpack is currently progressing only slowly. Wet snow avalanches that can sweep away the entire snowpack are therefore relatively rare. The most critical areas are north-facing slopes between 2200 and 2600 m, where the snowpack is becoming saturated for the first time.

Weather review for Friday

Overnight to Friday saw occasionally cloudy skies. During the day, conditions were often sunny with some cumulus clouds and isolated showers.

Fresh snow

-

Temperature

At midday at 2000 m, around +7 °C

Wind

Light to moderate southwesterly

Weather forecast to Saturday

The night to Saturday will mostly be clear. During the day, conditions will be very sunny with cumulus clouds and isolated showers as the day progresses.

Fresh snow

-

Temperature

At midday at 2000 m, around +7 °C

Wind

Mostly light southwesterly

Outlook to Monday

The night to Sunday will be mostly overcast while, during the day, it will be very cloudy with some precipitation, especially in the south. The snowfall level will be around 2400 m and there will be a moderate southerly wind at times in the high Alpine regions. Monday will likewise often be overcast, with some widespread precipitation, which will be heaviest in the west, where 10 to 20 cm of snow is expected at high altitudes. The snowfall level will be around 2200 m, with a moderate to strong westerly wind at high altitudes.

The danger of dry avalanches will not change significantly on Sunday, but will increase somewhat on Monday. During the overcast nights, there will be little outgoing radiation from the snowpack, meaning the danger of wet avalanches will be subject to little diurnal variation. Due to the relatively cool weather, avalanche activity is expected to remain low.
