

10

As the day progresses as a consequence of warming during the day and solar radiation there will be an increase in the danger of moist avalanches to level 2 (moderate). This applies in particular on very steep slopes, and at the base of rock walls. Gliding avalanches can also occur. This applies especially in case of very steep starting zones.

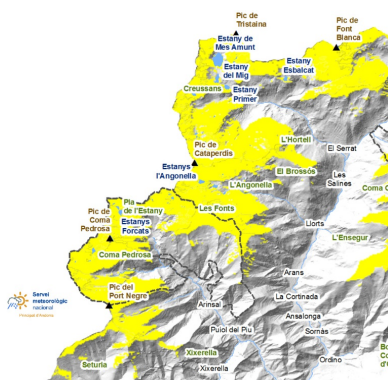

New snow is lying on an icy crust. The surface of the snowpack will freeze to form a strong crust and will soften earlier than the day before. Caution is to be exercised in areas with glide cracks. At high altitudes and in high Alpine regions the amount of snow is subject to significant local variations. The weather will be very warm.

North zone					Center area					South zone				
		Snow thickness					Snow thickness					Snow thickness		
Snowpack		1500m	2000m	2500m	Snowpack		1500m	2000m	2500m	Snowpack		1500m	2000m	2500m
N	2100 m	0 cm	0 cm	100 cm	N	2100 m	0 cm	0 cm	100 cm	N	2100 m	0 cm	0 cm	100 cm
S	2400 m	0 cm	0 cm	80 cm	S	2400 m	0 cm	0 cm	70 cm	S	2400 m	0 cm	0 cm	70 cm

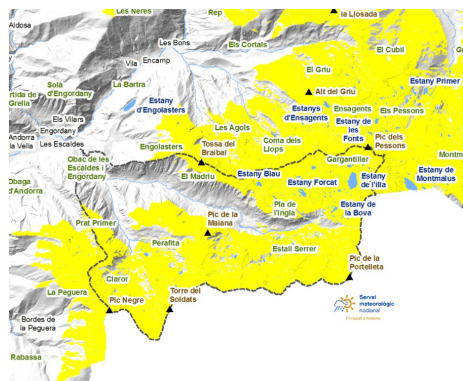

[illegible]

The new snow has already moistened and frozen on all slopes and heights. We still find continuous snow on the northern slopes of the Ransol, Sorteny and Rialb valleys, although we will have to make approaches on foot.

In general, we will find continuous snow above the Pla de l'Estany and the Comapedrosa refuge. The thickness of snow is the usual for this time of year, with numerous routes that can still be done with mountain skis between Andorra l'Arèja and Catalonia.

Access to the Valley from Grau Roig can still be done by skiing on the ski slopes, although with some approaches on foot. There is still snow on the southern slopes of Engait, Picos Negres d'Envalira and l'Illa which allow you to connect with El Madriu, Grau Roig and Pas de la Casa.
