

1

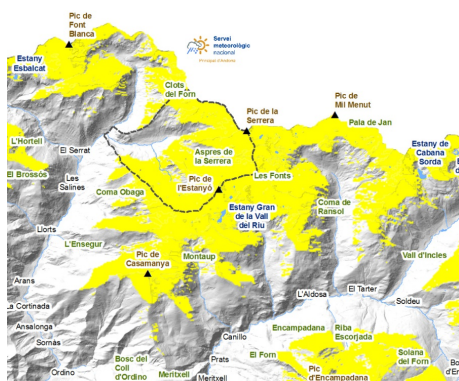

As the day progresses as a consequence of warming during the day and solar radiation there will be an increase in the danger of moist avalanches to level 2 (moderate). This applies in particular on very steep slopes, and at the base of rock walls. Gliding avalanches can also occur. This applies especially in case of very steep starting zones.

New snow is lying on an icy crust. The surface of the snowpack will freeze to form a strong crust and will soften earlier than the day before. Caution is to be exercised in areas with glide cracks. At high altitudes and in high Alpine regions the amount of snow is subject to significant local variations. The weather will be very warm.

North zone					Center area					South zone				
		Snow thickness					Snow thickness					Snow thickness		
Snowpack		1500m	2000m	2500m	Snowpack		1500m	2000m	2500m	Snowpack		1500m	2000m	2500m

Detailed information for protected areas

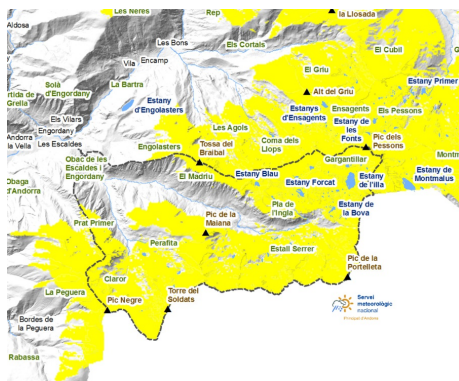

SORTENY

The new snowfalls have left thin sheets of windy snow on top of the old snow, of a thickness that facilitates the ascents but still makes it difficult to descend, as it is wet or encrusted snow. The snow is still continuous on the northern slopes of the Ransol, Sorteny and Rialb valleys, although we will have to make some approaches on foot.

COMAPEDROSA

In general, we will find continuous snow above the Pla de l'Estany and the Comapedrosa refuge. The thickness of snow is the usual for this time of year, with numerous routes that can still be done with mountain skis between Andorra l'Arièja and Catalonia. If we wait to step on the new snow until it has frozen, with calm nights at the end of the week, it will be more pleasant to ski.

MADRIU-PERAFITA-CLAROR

Access to the Valley from Grau Roig can still be done by skiing on the ski slopes. everywhere There is still snow on the southern slopes of Engait, Picos Negres d'Envalira and l'Illa which allow you to connect with El Madriu, Grau Roig and Pas de la Casa.
