SNOW QUALITY

The conditions are spring-like. As the penetration by moisture increases more small to medium-sized moist and wet avalanches are possible. Caution is to be exercised in areas with glide cracks. This applies in particular in case of steep starting zones that still retain some snow. Tuesday : As the temperature drops there will be a decrease in the danger of wet avalanches in the early morning.

STABILITY OF THE SNOW MANTLE

The snowpack will be moist. Outgoing longwave radiation during the night will be severely restricted. The rain to a loss of strength within the snowpack. Areas with glide cracks are to be avoided. Backcountry tours should be started and concluded early. Tuesday : Slight decrease in danger of wet avalanches as the temperature drops.

OFF-PISTE SNOW COVER THICKNESSES

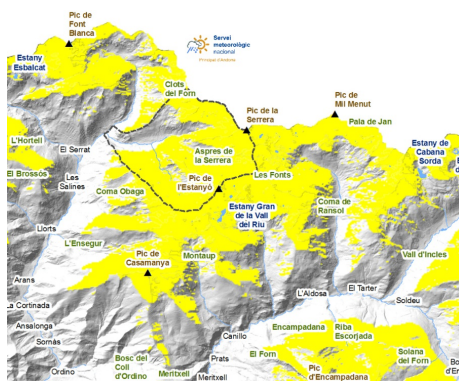

North zone					Center area					South zone				
Snow thickness					Snow thickness					Snow thickness				
Snowpack					Snowpack					Snowpack

Detailed information for protected areas

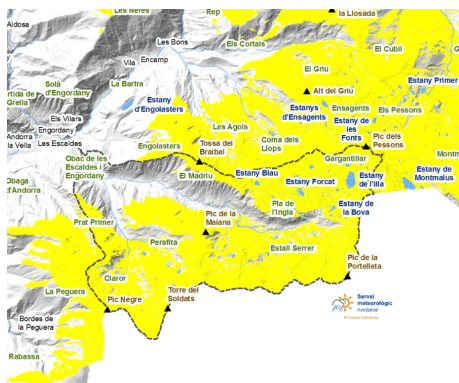

SORTENY

The snow cover is becoming more and more precarious and humidification is reaching the entire thickness of the cover. The slight drop in temperatures will allow a more effective frost in the early hours of the day and the drop in the snow level may leave a slight dust on the peaks.

COMAPEDROSA

In the early hours we may find a thin crust of ice, but the snow is, in general, soft. Pay attention to the ice bridges above the torrents, as they are weakened by the increase in river flow and the weakening of the snow cover.

MADRIU-PERAFITA-CLAROR

The moisture is reaching the deepest layers of the mantle favoring a cycle of natural wet snow avalanches and basal slides. We only find continuous snow at high altitudes.
