Avalanche bulletin through Sunday, 25. October 2026

Avalanche danger

updated on 24.10.2026, 17:00

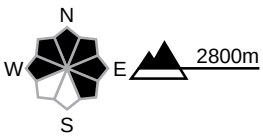

region A

Considerable (3-)

New snow

Avalanche prone locations

Danger description

30 to 40 cm of snow has fallen since Wednesday above approximately 2200 m. 20 to 30 cm of snow will fall on Sunday above approximately 2800 m. As a consequence of a strong to storm force westerly wind, avalanche prone wind slabs will form. New snow and wind slabs can in some places be released by people. As the precipitation becomes more intense more frequent natural dry avalanches are to be expected in the afternoon, in particular medium-sized ones. Backcountry touring calls for experience in the assessment of avalanche danger.
The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Low (1)

Wet snow

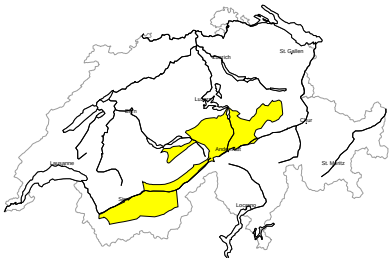

As a consequence of the rain more frequent moist loose snow avalanches are to be expected from the second half of the night, even medium-sized ones. This applies in particular below approximately 2600 m.

Danger levels 1 low 2 moderate 3 considerable 4 high 5 very high

Avalanche bulletin through Sunday, 25. October 2026

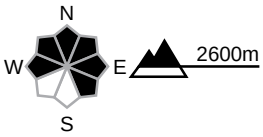

region B

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

In some regions 20 to 40 cm of snow has fallen since Wednesday above approximately 2200 m. 15 to 30 cm of snow will fall on Sunday above approximately 2800 m. As a consequence of a strong to storm force westerly wind, avalanche prone wind slabs will form in particular adjacent to ridgelines and in gullies and bowls. These can in some places be released by people. Avalanches can reach medium size.
Backcountry touring calls for careful route selection.
The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

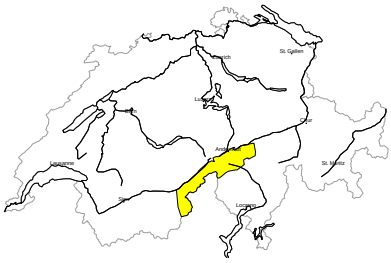

Low (1)

Wet snow

As a consequence of the rain more frequent moist loose snow avalanches are to be expected from the second half of the night, even medium-sized ones. This applies in particular below approximately 2600 m.

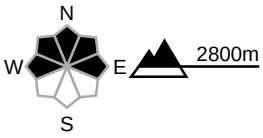

region C

Moderate (2=)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

As a consequence of a strong to storm force westerly wind, mostly small wind slabs will form in the course of the day in some localities. The new snow and wind slabs are lying on top of a weakly bonded old snowpack especially on shady slopes in high Alpine regions. Persons can release avalanches in some places, including medium-sized ones.
Backcountry touring calls for careful route selection.
The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

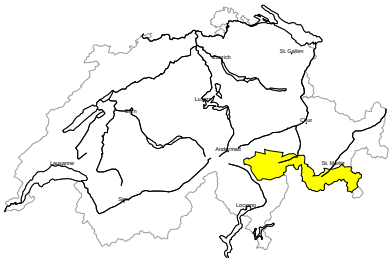

Low (1)

Wet snow

As a consequence of the rain more frequent moist loose snow avalanches are to be expected from the second half of the night, even medium-sized ones. This applies in particular below approximately 2600 m.

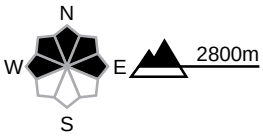

Avalanche bulletin through Sunday, 25. October 2026

region D — Moderate (2=)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

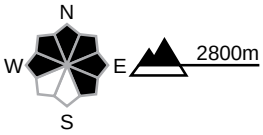

As a consequence of a strong to storm force westerly wind, mostly small wind slabs will form in the course of the day in some localities. The new snow and wind slabs are lying on top of a weakly bonded old snowpack especially on shady slopes in high Alpine regions. Persons can release avalanches in some places, including medium-sized ones.
Backcountry touring calls for careful route selection. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region E — Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

In some regions 15 to 25 cm of snow has fallen since Wednesday. As a consequence of a moderate to strong westerly wind, sometimes avalanche prone wind slabs will form in particular adjacent to ridgelines and in gullies and bowls. These can in some places be released by people. Avalanches can in isolated cases reach medium size.
Backcountry touring calls for careful route selection. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region F — Low (1)

Wet snow

As a consequence of the rain more frequent moist loose snow avalanches are to be expected from the second half of the night, even medium-sized ones. This applies in particular below approximately 2600 m.

Snowpack and weather

updated on 24.10.2026, 17:00

Snowpack

Between Wednesday and Saturday, snowfall accompanied by moderate to strong winds was widespread at high altitudes, with the largest amounts falling in the Bernese and Valais Alps and in the Bernina region. Around half a metre of snow fell above 2800 m in these regions. In high alpine regions along the main Alpine ridge from the Monte Rosa region to the Bernina region, the fresh snow was deposited on a thin but already continuous snow cover. Faceted weak layers are present near the ground in these regions. Elsewhere, weak layers are to be expected mainly within the various layers of fresh snow and wind-drifted snow.
As the snowfall level rises to around 2600 m during the night to Sunday, the snowpack will become moist or wet over widespread areas, including at high altitudes.

Outlook

Monday
On Monday, it will be partly cloudy in the north and mostly sunny elsewhere. The zero-degree level will rise to above 3000 m during the day. The wind will be mostly moderate from westerly directions.
The danger of dry avalanches will decrease. Particularly on steep north-facing slopes in high alpine regions, avalanches can still be triggered by people. As a result of solar radiation, moist loose snow slides and avalanches are to be expected on steep slopes in high alpine regions.

Tuesday
On Tuesday, it will be mostly sunny and mild. The zero-degree level will rise to 4000 m. The wind will be light to moderate from westerly directions.
The danger of dry avalanches will decrease further. As temperatures rise, the snowpack will become moist up to high alpine altitudes. Small and medium-sized wet loose snow avalanches are possible. In addition to the danger of being buried, particular attention should be paid to the danger of being swept along and falling.
