

Avalanche danger
updated on 17.5.2026, 17:00

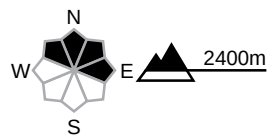

region A

Moderate (2+)

New snow, Persistent weak layers

Avalanche prone locations

Danger description

The new snow and wind slabs of the last few days are in some cases still prone to triggering. Dry avalanches can additionally in isolated cases be released in deeper layers in particular on very steep north and east facing slopes. Avalanches can reach large size in isolated cases. Ski touring calls for careful route selection. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

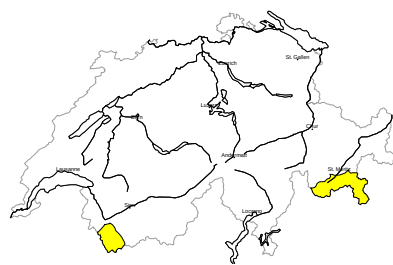

Low (1)

Wet snow

As a consequence of warming during the day and solar radiation moist snow slides are to be expected. These are rather small. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

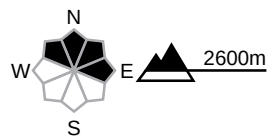

region B

Moderate (2+)

Wind slab, Persistent weak layers

Avalanche prone locations

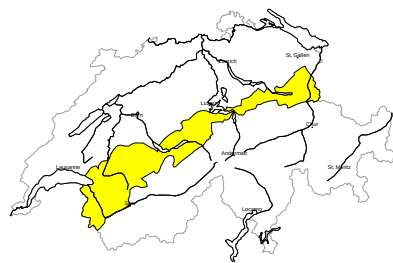

Danger description

The wind slabs of the last few days are in some cases still prone to triggering. Dry avalanches can additionally in isolated cases be released in deeper layers in particular on very steep north and east facing slopes. Avalanches can reach large size in isolated cases. Ski touring calls for careful route selection. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

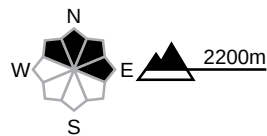

region C

Moderate (2=)

No distinct avalanche problem

Avalanche prone locations

Danger description

Dry avalanches can in some places be released in near-surface layers. The avalanche prone locations are to be found in particular on very steep north and east facing slopes. Avalanches can reach medium size. Careful route selection is recommended. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

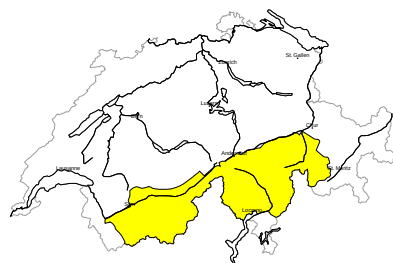

Low (1)

Wet snow

As a consequence of warming during the day and solar radiation moist snow slides are to be expected. These are rather small. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

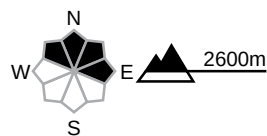

region D

Moderate (2=)

No distinct avalanche problem

Avalanche prone locations

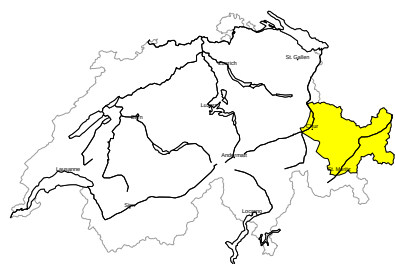

Danger description

Dry avalanches can in some places be released in near-surface layers. The avalanche prone locations are to be found in particular on very steep north and east facing slopes. Avalanches can reach medium size. Careful route selection is recommended. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

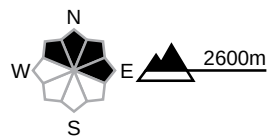

region E

Moderate (2=)

No distinct avalanche problem

Avalanche prone locations

Danger description

Dry avalanches can in some places be released in near-surface layers. The avalanche prone locations are to be found in particular on very steep north and east facing slopes. Avalanches can reach medium size. Careful route selection is recommended.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Low (1)

Wet snow

As a consequence of warming during the day and solar radiation moist snow slides are to be expected. These are rather small. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

Avalanche bulletin through Monday, 18. May 2026**Snowpack and weather**

updated on 17.5.2026, 17:00

Snowpack

The new snow and wind-drifted snow from recent days are still partly prone to triggering, especially on shaded slopes in high alpine terrain. At the transition to the underlying old snowpack, coarse-grained weak layers are still present in some places, particularly on north- and east-facing slopes at higher elevations.

Weather review for Sunday

After a clear night, it was quite sunny with some cumulus clouds

Fresh snow

-

Temperature

At midday at 2000 m, between -1 °C in the north and +4 °C in the south

Wind

Continued moderate winds from the north along the Main Alpine Ridge during the night and mostly light winds during the day

Weather forecast to Monday

The night will be partly clear in the east, and cloudy elsewhere. In the morning there will be continued bright spells, especially in the east. Elsewhere it will often be cloudy with local showers, especially on the northern flank of the Alps. The snowfall level will be around 1800 m.

Fresh snow

A few centimetres locally in the form of showers, especially in the north

Temperature

At midday at 2000 m, between +1 °C in the north and +4 °C in the south

Wind

Often light, occasionally moderate southwesterly at high altitudes in the west

Outlook to Wednesday

Monday night into Tuesday will be partly cloudy in the east and a little snow will fall above 1800 m. In the morning, there will still be residual clouds in the east. Elsewhere, it will be quite sunny at first before clouds move in from the west. In the afternoon, there will be showers in the west, falling as snow above 2200 m. Tuesday night into Wednesday will be clear in the south and often cloudy elsewhere. In central and eastern Switzerland, up to 10 cm of snow will fall above approximately 2200 m. During the day, it will be cloudy with showers in the east. In the west, conditions will be changeable, and in the south it will be quite sunny. There will be a westerly wind on both days, mostly light on Tuesday and moderate at times on Wednesday. The zero-degree level will be at 2500 m on Tuesday, rising towards 2800 m on Wednesday afternoon. The danger of dry avalanches will decrease. Dry avalanches can still be triggered, primarily on very steep north- and east-facing slopes in the high alpine regions. The danger of wet avalanches will increase slightly as each day progresses. Backcountry ski tours should be completed early.
