

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Monday 04 05 2026

Wet snow

Wet and gliding snow require caution. This is the final hazard map for the winter 2025/26. The next avalanche bulletin will appear on 1 December, or sooner in the event of an unexpected change in the avalanche situation.

In particular in starting zones where no previous releases have taken place more small and, in isolated cases, medium-sized gliding avalanches and wet snow slides are possible especially at high altitude.

Snowpack

Danger patterns

dp.10: springtime scenario

Below approximately 1800 m only a little snow is lying. In gullies and bowls at high altitude there is still a very large amount of snow. The spring-like weather conditions will give rise to increasing moistening of the snowpack.
