

1

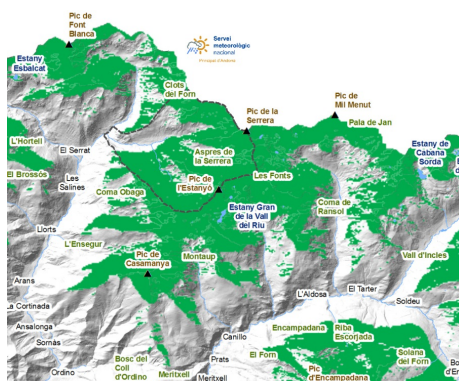

The conditions are spring-like. As the penetration by moisture increases more small to medium-sized gliding avalanches and moist snow slides are possible. Caution is to be exercised in areas with glide cracks. This applies in particular in case of steep starting zones that still retain some snow. As the temperature drops there will be a decrease in the danger of wet avalanches. On sunny slopes a quite favourable avalanche situation will prevail.

The snowpack will be quite moist. A clear night will be followed by sometimes favourable conditions at elevated altitudes. The surface of the snowpack will freeze to form a strong crust only at high altitudes and will soften during the day. In steep terrain there is a danger of falling on the hard snow surface. In some regions 5 cm of snow will fall in the afternoon above approximately 2500 m. Areas with glide cracks are to be avoided. Backcountry tours should be concluded timely.

North zone					Center area				South zone					
		Snow thickness					Snow thickness				Snow thickness			
Snowpack		1500m	2000m	2500m	Snowpack		1500m	2000m	2500m	Snowpack		1500m	2000m	2500m
N	2000 m	0 cm	70 cm	150 cm	N	2000 m	0 cm	50 cm	100 cm	N	2000 m	0 cm	50 cm	100 cm

Detailed information for protected areas

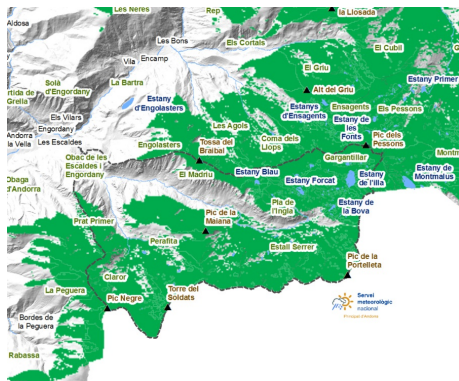

SORTENY

The snow cover is becoming more and more precarious and humidification has reached the entire thickness of the cover. The slight drop in temperatures will allow a more effective surface frost in the early hours of the day and the drop in the snow level may leave a slight dust on the peaks.

COMAPEDROSA

In the early hours we may find a thin crust of ice, but the snow is, in general, soft. Pay attention to the ice bridges above the torrents, as they are weakened by the increase in river flow and the weakening of the snow cover.

MADRIU-PERAFITA-CLAROR

The moisture has reached the deepest layers of the mantle favoring a cycle of natural wet snow avalanches and basal slides. We only find continuous snow at high altitudes.
