As a consequence of the new snow small moist snow slides are possible. This applies in particular in case of very steep and sunny starting zones. Gliding avalanches can also occur at any time. As a consequence of , small wind slabs formed on Tuesday on northwest , north and northeast facing slopes.

New snow is lying on an icy crust. As a consequence of solar radiation the snowpack will consolidate. Caution is to be exercised in areas with glide cracks.

Detailed information for protected areas

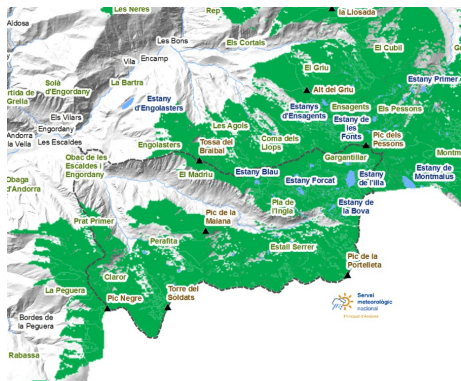

SORTENY

With the drop in temperatures and the new snowfalls, although they have been weak, the situation has changed slightly. On top of the old snow we find a thin layer of recent snow that facilitates both ascents and descents, but we will have to watch out for the stones that may hide. The snow is still continuous on the northern slopes of the Ransol, Sorteny and Rialb valleys, although we will have to make some short approaches on foot.

COMAPEDROSA

The new snow on the surface will gradually moisten throughout the day and some wet snow purges may occur on the steeper southern slopes. In general, we will find continuous snow above the Pla de l'Estany and the Comapedrosa refuge. The thickness of snow is the usual for this time of year, with numerous routes that can still be done with mountain skis between Andorra l'Arièja and Catalonia. At altitude there may be some wind patches on north-facing slopes that may be sensitive to overloads.

MADRIU-PERAFITA-CLAROR

The accesses to the Valley from Montmalús continue to have good snow and with similar conditions everywhere. There is still snow on the southern slopes of Engait, Picos Negres d'Envalira and l'Illa which allow you to connect with El Madriu, Grau Roig and Pas de la Casa.
