Wet snow

Wet and gliding snow require caution.

In particular in starting zones where no previous releases have taken place more small and, in isolated cases, medium-sized gliding avalanches and wet snow slides are possible especially at high altitude.

Snowpack

Danger patterns

dp.10: springtime scenario

Below approximately 1800 m only a little snow is lying. In gullies and bowls at high altitude there is still a very large amount of snow. The spring-like weather conditions will give rise to increasing moistening of the snowpack.
