Avalanche bulletin through Thursday, 12. November 2026

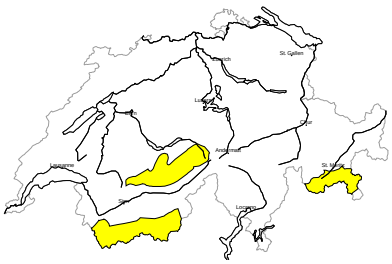

Avalanche danger

updated on 11.11.2026, 17:00

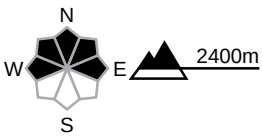

region A

Moderate (2+)

Persistent weak layers

Avalanche prone locations

Danger description

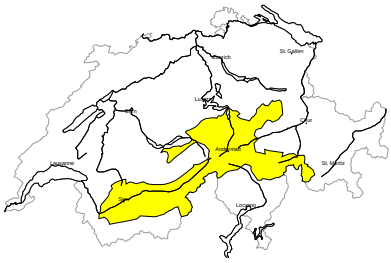

Up to 15 cm of snow has fallen since Monday above approximately 2200 m. 10 to 20 cm of snow will fall on Thursday, in particular at high altitude. The new snow and wind slabs are lying on top of a weakly bonded old snowpack in particular on shady slopes above approximately 2400 m. Avalanches can be released in the old snowpack by people. They can in isolated cases reach medium size.
Backcountry touring calls for careful route selection.
The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Danger levels 1 low 2 moderate 3 considerable 4 high 5 very high

Avalanche bulletin through Thursday, 12. November 2026

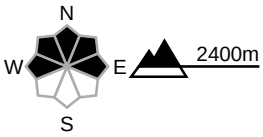

region B

Moderate (2-)

Persistent weak layers

Avalanche prone locations

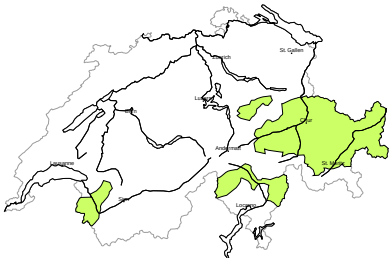

Danger description

Up to 10 cm of snow has fallen since Monday above approximately 2200 m. 5 to 15 cm of snow will fall on Thursday, in particular at high altitude. The new snow and wind slabs are lying on top of a weakly bonded old snowpack in particular on shady slopes above approximately 2400 m. Avalanches can be released in the old snowpack by people. Mostly these are small. Backcountry touring calls for careful route selection. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

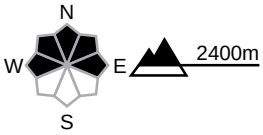

region C

Low (1)

No distinct avalanche problem

Avalanche prone locations

Danger description

In some localities up to 10 cm of snow has fallen since Monday above approximately 2200 m. 5 to 10 cm of snow will fall on Thursday, in particular at high altitude. Mostly small avalanches are possible in particular in extremely steep terrain.
Backcountry touring calls for careful route selection. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Snowpack and weather

updated on 11.11.2026, 17:00

Snowpack

Since Monday, snowfall has occurred at high altitudes, accompanied by moderate southwesterly winds. Further snowfall is expected above 2400 m until Thursday afternoon, particularly along the northern Alpine ridge and the main Alpine ridge. The new snow lies mainly on shaded slopes above approximately 2400 m, on top of a thin, mostly faceted old snowpack. Consequently, fractures are expected to occur within the old snowpack, particularly in areas where a continuous snow cover was already present before the snowfall.

Outlook

Friday
During the night into Friday, the snow line will drop to around 1000 m along the northern flank of the Alps. In the other regions, conditions will remain mild, with the snow line at around 2000 m. By midday on Friday, 5 to 15 cm of snow is expected to fall widely at higher elevations. The danger of dry avalanches will increase slightly.

Saturday
Saturday will be dry, with mostly sunny conditions in the north and partly sunny conditions in the south. On sunny slopes, isolated wet snow slides are possible due to the fresh snowfall. On shady slopes, the avalanche danger will remain largely unchanged.
