As a consequence of new snow and a moderate wind, small wind slabs will form in the course of the day adjacent to ridgelines on northeast, east and south facing slopes. In many cases they are small and in isolated cases easily released. Gliding avalanches can also occur at any time. This applies in particular in case of very steep starting zones. Sunday: as the day progresses as a consequence of warming during the day and solar radiation there will be an increase in the danger of moist snow slides.

Down to intermediate altitudes snow will fall in particular in the north. The moderate wind will transport the new snow. New snow is lying on an icy crust. Caution is to be exercised in areas with glide cracks. At high altitudes and in high Alpine regions the amount of snow is subject to significant local variations.

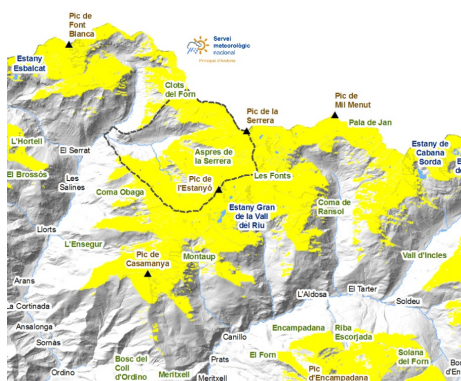

North zone					Center area					South zone				
		Snow thickness					Snow thickness					Snow thickness		
Snowpack		1500m	2000m	2500m	Snowpack		1500m	2000m	2500m	Snowpack		1500m	2000m	2500m

Detailed information for protected areas

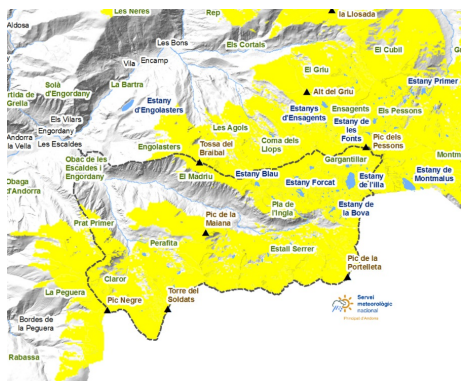

SORTENY

The new snowfalls have left thin sheets of windy snow on top of the old snow, of a thickness that facilitates the ascents and descents, but we will have to continue carrying knives or crampons to climb the steeper slopes. The snow is still continuous on the northern slopes of the Ransol, Sorteny and Rialb valleys, although we will have to make some approaches on foot.

COMAPEDROSA

In general, we will find continuous snow above the Pla de l'Estany and the Comapedrosa refuge. The thickness of snow is the usual for this time of year, with numerous routes that can still be done with mountain skis between Andorra l'Arièra and Catalonia.

MADRIU-PERAFITA-CLAROR

The accesses to the Valley from Montmalús continue to have good snow and with similar conditions everywhere. There is still snow on the southern slopes of Engait, Picos Negres d'Envalira and l'Illa which allow you to connect with El Madriu, Grau Roig and Pas de la Casa.
