SNOW QUALITY

The conditions are spring-like. As the penetration by moisture increases more small to medium-sized moist and wet avalanches are possible. Gliding avalanches can also occur at any time. Caution is to be exercised in areas with glide cracks. Caution is to be exercised in particular in case of starting zones that still retain some snow. The avalanche danger will persist. Natural avalanches and field observations confirm the existence of a weak snowpack.

STABILITY OF THE SNOW MANTLE

The snowpack will be moist. Outgoing longwave radiation during the night will be severely restricted. In the early morning the weather will be clear at times. Up to high altitudes rain will fall in the afternoon. These weather conditions will give rise to increasing moistening of the snowpack. Areas with glide cracks are to be avoided. Backcountry tours should be started and concluded very early.

OFF-PISTE SNOW COVER THICKNESSES

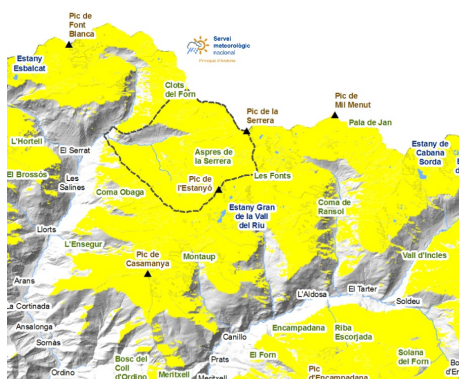

North zone					Center area					South zone				
Snow thickness					Snow thickness					Snow thickness				
Snowpack					Snowpack					Snowpack				
N	1800 m	0 cm	100 cm	200 cm	N	1800 m	0 cm	90 cm	130 cm	N	1800 m	0 cm	90 cm	130 cm
S	2200 m	0 cm	0 cm	150 cm	S	2200 m	0 cm	0 cm	100 cm	S	2200 m	0 cm	0 cm	90 cm

Detailed information for protected areas

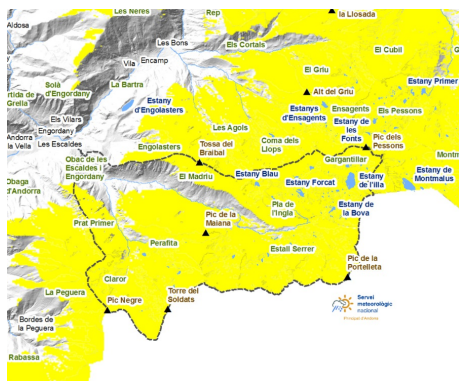

SORTENY

The snow cover is becoming more and more precarious. The night frost is not good or effective, therefore the circulation in the snow that has not been compacted throughout the season is more difficult.

COMAPEDROSA

The snow is generally wet. Attention to the ice bridges above the torrents, as they will be weakened by the increase in river flow and the weakening of the snow cover.

MADRIU-PERAFITA-CLAROR

The moisture is reaching the deepest layers of the mantle favoring a cycle of natural wet snow avalanches and basal slides. From the Estall Serrer downstream, there is no continuous snow left.
